

Know what your competitors did before your standup.

AdWatch watches every Google ad your competitors run, every keyword they bid on, and every shift in category demand — then tells you what changed, why it matters, and what to do next. Built on public data: nothing to connect, no ad-account access.

THE PROBLEM

Every paid-search team runs the same weekly ritual: open a competitor's transparency page, search your own keywords in an incognito window, check a trends chart, paste screenshots into a deck. It is slow, it is retrospective, and it has no concept of *change* — you get a snapshot, not a signal. Incumbent intelligence suites cost hundreds of dollars a seat and still deliver a report, not an alert.

THE PRODUCT

Watch	Diff	Explain	Alert & report
Competitor creatives (Ads Transparency Center), the live paid block on your keywords (Google Search), and demand (Google Trends) — via SerpApi, on a schedule.	Every run is compared to the last. Nine typed change kinds with severity. The first run is a silent baseline.	An AI analyst reads only the structured diff and writes what happened, why it matters, and 2–3 actions with effort and urgency.	High-severity insights hit team chat or email. One click renders a CFO spend-&-risk brief or a marketing action brief (PDF, DOCX, MD).

WHAT A MONDAY MORNING LOOKS LIKE

HIGH	new_serp_advertiser · dinnerdrop.example appeared at top #1 on "meal kit for two"
HIGH	creative_surge · PlateNest went from 7 to 11 active creatives (+57%), four of them video
HIGH	trend_spike · interest in "meal kit for two" is 1.7× its 4-week average; "date night meal kit" is Breakout
AI	"A new entrant took the top slot on your highest-intent query while demand for it nearly doubled. Ship a two-person plan landing page this week and add a 'date night' ad group; no tracked competitor owns the breakout yet." — now · low effort

Fictitious advertisers shown; in production the same events fire on real public data. The analyst may not invent numbers.

WHY NOW

Ad transparency data became public and, through SerpApi, structured and real-time — the sensor now exists. Language models made "explain the diff" cheap enough to run every cycle. And paid-search budgets are under scrutiny: finance wants competitive context for spend, not just performance dashboards. The wedge is the diff; the moat is the history of it.

TRACTION

Working product built in ~22 hours by three people: 9 change kinds, 3 report formats, control plane live, pipeline validated end-to-end. Next: three design-partner brands and two agencies on live watchlists for 30 days.

TEAM

Joseph Karns — product, infrastructure & frontend; DevOps engineer, cloud-agnostic
Divya — backend & collectors
Seema Gupta — backend & data

THE ASK

Design partners with real watchlists, SerpApi volume for pilots, and introductions to agencies that bill for competitive reporting today.

WHO BUYS IT

Direct-to-consumer brands with a paid-search line item, and agencies running five to fifty client accounts who do this ritual for every one of them. Expansion: multi-channel coverage and own-account overlay (import campaign reports to see spend against competitor moves).

BUSINESS MODEL

Free \$0 · 1 watchlist, daily runs, chat alerts

Team \$49/mo · 5 watchlists, 6-hourly runs, reports

Agency \$199/mo · unlimited, client workspaces, white-label

Per-workspace SaaS with metered collection runs; a fraction of incumbent per-seat pricing because the data is public and the analysis is automated.

HOW IT'S BUILT

Sensor	SerpApi — 3 engines, 18 searches per run for a 3×5 watchlist
Control plane	Xano — auth, workspaces, alert routing, 6-hourly scheduler
Data plane	FastAPI + Postgres; diff engine, Claude analyst, report renderers
Frontend	Next.js dashboard; containers on any cloud, CI on push
